DATE MAILED: 12/23/2004

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No. 10/024,658	Applicant(s) CHOY ET AL.	
	Examiner Frederick J. Parker	Art Unit 1762	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 16 November 2004.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 37-72 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 37-58 and 67-72 is/are rejected.
- 7) ☒ Claim(s) 59-66 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Amendment

Specification

The amendments in response to the Objections to the specification of the Previous Office Action are acknowledged and appreciated, and the Examiner withdraws the objections.

Claim Objections

The Claims Objections of the Previous Office Action are withdrawn in view of cancellation of claims 1-36.

Double Patenting

The DP Rejections of the Previous Office Action are withdrawn in view of cancellation of claims 1-36. The new rejections are necessitated by new claims.

1. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

2. Claims 37-72 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-31 of U.S. Patent No. 6331330 ('330).

Although the conflicting claims are not identical, they are not patentably distinct from each other because instant claims 37 and 50 meet all limitations of claim 1 of '330 except '330 further requires that the temperature gradient evaporate solvent and cause precursor decomposition, which would be inherent to the process of instant claim 1 by virtue of the heated substrate (42).

Art Unit: 1762

Similar rationale is applied to claim 72. Instant claims 38-49, 51-68 correspond to '330 claims 2-13, 14-68; instant 69 is in claim 1 of '330; claim 70 is disclosed by claims 1 & 11 of '330; claim 71 is disclosed by claims 1 & 13 of '330. Thus the claims of the instant application are merely obvious variations of US'330 and accordingly not patentably distinct.

Claim Rejections - 35 USC § 102

The Rejections under 35 USC 102 of the Previous Office Action are withdrawn in view of cancellation of claims 1-36. The new rejections are necessitated by new claims.

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

1. Claims 37-40, 42-48, 58, 68-70 are rejected under 35 U.S.C. 102(b) as being anticipated by Kim et al US 5,344,676.

Kim et al teaches a method for applying nanodrops to a substrate to form a coating film or nanoparticles (= powder, col. 3, 23). A polymeric sol-type precursor material 9 comprises a decomposable base material with a solvent. The sprayed liquid droplets are electrostatically charged with a negative or positive polarity, and an electric field generated between the charged droplets and electrode needle 14 as described provides a corona spray. The entire apparatus is contained within chamber 22 per claim 33, which may contain an inert or reactive gas (clm 58). The target area is heated by heater 34 to promote reactions and specific heating temperatures would have been dependant upon the decomposition temperature of any precursor in order to form the desired coating material. There would have inherently been a decrease in temperature as

Art Unit: 1762

a function of distance from the heated substrate towards the outlet. Solvent evaporation and precursor decomposition would have inherently occurred as atomized particles approach the substrate to satisfy the requirement of forming a coating film or nanoparticles. Coating solution is transported from supply 2 to the spray outlet using capillary tube device 10 and accelerated/focused by an electric field or magnetic field (col. 3, 63 to col. 4, 2). Rotating the target relative to the sprayed nanodroplets to produce uniform deposition is taught on col. 4, 12-16. As the atomized droplets approach the heated substrate, and solvent is evaporated and/or precursor reaction occurs, the solution concentration/composition would be changed per claim 40.

2. Claim 72 is rejected under 35 U.S.C. 102(b) as being anticipated by Spiller US 3754975.

Spiller teaches a method of coatings a substrate by supplying a coating solution under pressure comprising a solvent and decomposable metal salt ("precursor compound") which is sprayed (inherently involves "pressure feeding") through a nozzle of a spray head onto the heated substrate to decompose the solution to form a coating, the heated substrate providing an increase in temperature from the spray outlet towards the heated substrate (and therefore inherently also a decreasing temperature gradient from the heated substrate towards the nozzle). The sprayed particles adhere to the substrate by utilization of an electrostatic field between particles and substrate, the particle charging as described on col. 8, Example, etc forming an atomized corona spray of droplets.

Claim Rejections - 35 USC § 103

The Rejections under 35 USC 103 of the Previous Office Action are withdrawn in view of cancellation of claims 1-36. The new rejections are necessitated by new claims.

Art Unit: 1762

3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

4. Claims 41,49,55-57,67,71 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kim et al.

Kim et al is cited for the same reasons previously discussed, which are incorporated herein.

While varying electric field polarity of claim 41 is not cited, it is the Examiner's position that doing so is well-known in the electrostatic coating arts to allow formation of thicker coatings by eliminating electrostatic repulsion between layers, to form overlying layers which would have been expected to form in the thickness ranges of claim 67. Per claim 49, maintaining the electrostatic field during cooling of the applied coat would have been an obvious variation to assure adherence of the coat to the substrate. The voltage range of claim 55 overlaps the KV range of Kim et al on col. 3, 56. The subject matter as a whole would have been obvious to one of ordinary skill in the art at the time the invention was made if the overlapping portion of the KV range disclosed by the reference were selected because overlapping ranges have been held to be a prima facie case of obviousness, see *In re Wortheim* 191 USPQ 90. While the temperature ranges of claims 56-57 are not cited, it is the Examiner's position that since the temperature of the substrate is dependant upon the solvent and precursor material applied, the temperature gradient would have been dependant upon such factors, as well as the ambient temperature, temperature of surrounding gas, etc, such that the gradient temperatures would have been obvious variations based upon the obvious processes parameters apparent to the skilled artisan.

Art Unit: 1762

5. Claims 50-54 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kim et al in view of Clark US 4921731 or Chivukala US 6066581.

Kim et al is cited for the same reasons previously discussed, which are incorporated herein.

PH modifying catalysts are not disclosed.

Clark et al teaches a method for forming sol coatings onto substrates in which a precursor solution is formed using organ metallic compounds such as metal alkoxides, ethoxides, methoxides, etc; orthosilicates (encompassing or reasonably suggesting polymeric organosiloxanes); and mixtures thereof in an aqueous or water-organic solvent mixture, in which the pH is necessarily adjusted by use of a suitable acid , inorganic salt or base (col. 7, lines 6-15; col. 7, lines 21-41). The use of such pH agents causes hydrolysis and peptization to promote stability of the sol particles formed. Alternatively col. 2, 49-59 of Chivukula et al teaches hydrolysis and polymerization is controlled by pH/ presence of acid or base catalysts in similar precursor systems. Hence, one of ordinary skill would have recognized the importance of adjusting pH using the pH agents of Clark et al or Chivukula et al a sol-based coating process, including that of Kim et al, to derive the recognized benefits of hydrolysis and stabilization of the sol particles formed.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the electrostatic spray process of Kim et al by incorporating the teachings regarding pH agents of Clark et al or Chivukula et al to attain the recognized benefits of hydrolysis and peptization to promote stability of the sol particles formed in the electrostatic spray coating process.

Art Unit: 1762

6. The prior art does not teach nor suggest the specific composition formulations of claims 59-66; those claims are objected to for depending from a rejected base claim.

7. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Frederick J. Parker whose telephone number is 571/ 272-1426. The examiner can normally be reached on Mon-Thur. 6:15am -3:45pm, and alternate Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Shrive Beck can be reached on 571/272-1415. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
